

Predicting Youth Violence Driven by School Fear

Course: Spring 2026 Stat 2
Name: [張智源Jerry] | Student ID: [112370234] |

Research Question

Does school-induced fear predict adolescent violence and weapon carrying, controlling for sex and depression?

Method

OLS Multiple Linear Regression

Variables

X (Predictor): Safety_Days_Missed (0-6 days)
Y (Response): Violence_Risk_Score (0-4 scale)
Controls: Biological Sex & Depression

Key Results

Fear Effect:
+0.24 violence score per day missed ($p < 0.001$).

Gender Gap:
Males inherently score +0.53 higher than females ($p < 0.001$).

"Perfect Storm":
Depression adds +0.28 to the risk score ($p < 0.001$).

Conclusion

School violence links strongly to a "survival mode" triggered by environmental insecurity. Males and depressed students are more likely to externalize fear into aggression.
